
WISCONSIN BEHAVIORAL RISK FACTOR SURVEY *******
1999

The 1999 Wisconsin Behavioral Risk Factor Survey (BRFS) provides information based on responses from 2,177 adults (age 18 and older). Results are weighted to represent the 2.7 million adults ages 18-54, and 1.2 million age 55 and older, living in Wisconsin households.

Ss = Sample size too small (fewer than 100 cases)

^{***} Excluding women who have had a hysterectomy

TECHNICAL NOTES

The Behavioral Risk Factor Survey is a representative, statewide telephone survey of Wisconsin household residents 18 years and older. Results are based on self-reports from respondents who are selected through a stratified random sample. Results are weighted to account for both nonresponse and sample design, and to adjust for the age-sex distribution of Wisconsin's population. The survey was designed by the Bureau of Health Information in cooperation with the U.S. Centers for Disease Control and Prevention. Survey sampling and interviewing were conducted by the Wisconsin Survey Research Laboratory, University of Wisconsin-Extension.

In 1999, 1,518 respondents were 18 to 54 years old, and 659 were 55 or older. There were 2,205 respondents in 1998 and 1,260 in 1990.

Columns labeled (+/-) indicate the 95% confidence interval associated with each estimate. For example, for all adults whose health is excellent or very good (59%), there is a 95% chance that the actual percentage falls within the range of plus or minus 2 percentage points (57%-61%).

The Centers for Disease Control and Prevention provided the following definitions: **Current smokers** are those who smoke currently, either every day or only some days, and have smoked more than 100 cigarettes in their lifetime. **Overweight** is defined by the Body Mass Index (BMI), a calculation (weight in kilograms divided by height in meters squared) using self-reported height and weight. A BMI greater than 27.3 for females and 27.8 for males is considered overweight. A **drink** of alcohol is defined as one can or bottle of beer, one glass of wine, one can or bottle of wine cooler, one cocktail, or one shot of liquor. The prevalence of **diabetes** is likely to be an underestimate because a significant proportion of adults have never been tested.

Differences in estimates between years, age groups, or sexes may not be statistically significant. For additional information about the BRFS, call Karl Pearson at 608-266-1920. For other health data, visit our Web site at http://www.dhfs.state.wi.us/stats/index.htm
